Momentum, a fundamental concept in physics, involves the quantity of motion an object possesses and is crucial in understanding collisions, safety features, and various real-life applications. This article provides a comprehensive guide to common IGCSE physics momentum example questions, including strategies for solving them, key concepts, and practice problems to help you master this topic.

Understanding the Concept of Momentum in IGCSE Physics

Before diving into example questions, it's important to grasp the core principles related to momentum.

What is Momentum?

Momentum (p) is defined as the product of an object's mass (m) and its velocity (v):

Question:

A 2 kg ball is rolling at a velocity of 5 m/s to the right. What is its momentum?

Solution:

Using $(p = m \times v)$:

$$- (p = 2\text{ kg} \times 5\text{ m/s} = 10\text{ kg}\cdot\text{m/s})$$

Answer: The momentum is 10 kg·m/s to the right.

Example 2: Momentum Conservation in a Collision

Solution:

Assuming a perfectly elastic collision and using conservation of momentum:

Total initial momentum:

$$- (p_{\text{initial}} = (0.5\text{ kg} \times 4\text{ m/s}) + (0.5\text{ kg} \times 0\text{ m/s}) = 2\text{ kg}\cdot\text{m/s})$$

Total final momentum:

$$- (p_{\text{final}} = (0.5\text{ kg} \times 1\text{ m/s}) + (0.5\text{ kg} \times v_{\text{2}}))$$

Set initial and final momenta equal:

$$- (2 = 0.5 + 0.5 v_{\text{2}})$$

$$- (0.5 v_{\text{2}} = 1.5)$$

$$- (v_{\text{2}} = 3\text{ m/s})$$

Answer: The second ball moves at 3 m/s to the right after the collision.

Example 3: Impulse and Force

Initial momentum:

$$- (p_{\text{initial}} = 1\text{ kg} \times 10\text{ m/s} = 10\text{ kg m/s})$$

Final momentum:

$$- (p_{\text{final}} = p_{\text{initial}} + \Delta p = 10 + 100 = 110\text{ kg m/s})$$

Final velocity:

Common Example Questions and Solutions

Example 1: Calculating Momentum

Question:

A 0.5 kg ball is moving to the right at 4 m/s. What is its momentum?

Solution:

- Known: $m = 0.5 \text{ kg}$, $v = 4 \text{ m/s}$
- $p = m \times v = 0.5 \text{ kg} \times 4 \text{ m/s} = 2 \text{ kg}\cdot\text{m/s}$
- Answer: The momentum of the ball is 2 kg·m/s to the right.

Example 2: Finding Velocity from Momentum

Question:

A car of mass 1000 kg has a momentum of 20,000 kg·m/s. What is its velocity?

Solution:

- Known: $p = 20,000 \text{ kg}\cdot\text{m/s}$, $m = 1000 \text{ kg}$
- $v = p / m = 20,000 / 1000 = 20 \text{ m/s}$

- Answer: The car's velocity is 20 m/s in the direction of the momentum.

Example 3: Collisions and Conservation of Momentum

Question:

A 2 kg ball moving at 3 m/s collides elastically with a stationary 3 kg ball. After the collision, the 2 kg ball moves at 1 m/s in the same direction. Find the velocity of the 3 kg ball after the collision.

Solution:

- Initial momentum of system:

$$p_{\text{initial}} = (2 \text{ kg} \times 3 \text{ m/s}) + (3 \text{ kg} \times 0) = 6 \text{ kg}\cdot\text{m/s}$$

- Final momentum:

$$p_{\text{final}} = (2 \text{ kg} \times 1 \text{ m/s}) + (3 \text{ kg} \times v?)$$

- By conservation of momentum:

$$6 = 2 \times 1 + 3 \times v?$$

$$6 = 2 + 3v?$$

$$3v? = 4$$

$$v? = 4 / 3 \approx 1.33 \text{ m/s}$$

- Answer: The 3 kg ball moves at approximately 1.33 m/s after the collision.

Example 4: Explosive Collision (Explosion)

Question:

A 0.2 kg object moving at 5 m/s explodes into two pieces. One piece of mass 0.1 kg moves at 8 m/s to the right. Find the velocity of the other piece.

Solution:

- Initial momentum:

$$p_{\text{initial}} = 0.2 \text{ kg} \times 5 \text{ m/s} = 1 \text{ kg}\cdot\text{m/s to the right.}$$

- Final momentum:

$$p_{\text{final}} = (0.1 \text{ kg} \times 8 \text{ m/s}) + (0.1 \text{ kg} \times v?)$$

- Conservation of momentum:

$$1 = 0.8 + 0.1v?$$

$$0.1v? = 1 - 0.8 = 0.2$$

$$v? = 0.2 / 0.1 = 2 \text{ m/s to the right.}$$

- Answer: The second piece moves at 2 m/s to the right.

Example 5: Impulse and Change in Momentum

Question:

A force of 50 N acts on a 0.5 kg object for 2 seconds. Find the change in momentum of the object.

Solution:

- Impulse = Force $\times$ Time = 50 N $\times$ 2 s = 100 N·s

- Change in momentum = Impulse = 100 kg·m/s

- Answer: The momentum of the object increases by 100 kg·m/s.

Tips for Mastering Momentum Questions

- Remember the vector nature: Direction matters. Be consistent with signs (+/-) depending on

motion.

- Ignoring directions: Momentum is vectorial; consider directions carefully.
- Using incorrect formulas: Ensure the formula matches the question context (e.g., conservation of momentum applies only in isolated systems).
- Forgetting to consider all objects: In collisions, account for all involved masses and velocities.

Final Thoughts

Mastering IGCSE Physics momentum example questions requires understanding the fundamental principles and practicing a variety of problems. By analyzing example questions systematically, applying the conservation of momentum correctly, and paying attention to units and directions, students can build confidence and improve their problem-solving skills. Regular practice with these types of questions will help you excel in your exams and deepen your understanding of the physics of motion.

Good luck with your studies!

Question What is the formula for calculating momentum in IGCSE Physics? The formula for momentum (p) is $p = \text{mass} \times \text{velocity}$, where mass is in kilograms and velocity in meters per second. An object with a mass of 3 kg is moving at 4 m/s. What is its momentum? Its momentum is $p = 3 \text{ kg} \times 4 \text{ m/s} = 12 \text{ kg}\cdot\text{m/s}$. In a collision, how does the law of conservation of momentum apply? The law states that the total momentum before the collision equals the total momentum after, assuming no external forces act on the system. A 2 kg ball moving at 5 m/s collides with a stationary 3 kg ball. If they stick together after collision, what is their combined velocity? Using conservation of momentum: $(2 \text{ kg} \times 5 \text{ m/s}) + (3 \text{ kg} \times 0) = (2 \text{ kg} + 3 \text{ kg}) \times v$. So, $10 = 5 \times v$, giving $v = 2 \text{ m/s}$. How does increasing the mass of an object affect its momentum if velocity remains constant? Increasing the mass increases the momentum proportionally, since $p = m \times v$. Describe what happens to the momentum of a car during a sudden stop. The car's momentum decreases rapidly to zero as the vehicle comes to rest, with the change in momentum causing forces on the brakes and passengers.

Why is momentum considered a vector quantity in physics? Because it has both magnitude and direction, like velocity, and the direction affects how momentum is conserved during collisions. What is an example of an impulse in the context of momentum? An impulse occurs when a force is applied over a period of time, such as hitting a ball with a bat, which changes the ball's momentum. How can you increase the change in momentum during an impact? By increasing the force applied or the duration over which the force acts, according to the impulse-momentum theorem.
