Sample Viva Voce Questions for Chemistry Class 12 with Answers

Below is a categorized list of common viva questions along with detailed answers to help students prepare effectively.

1. Solid State

- What is a crystal lattice?

A crystal lattice is a three-dimensional arrangement of ions, atoms, or molecules in a crystalline solid, repeating periodically in space. It defines the geometric pattern and symmetry of the crystal structure.

- Explain the difference between crystalline and amorphous solids.

Crystalline solids have a well-ordered, repeating arrangement of particles, resulting in sharp melting points and anisotropic properties. Amorphous solids lack long-range order, have irregular structures, and melt over a range of temperatures.

- What are unit cells? Describe different types of unit cells.

A unit cell is the smallest repeating unit in a crystal lattice that reflects the entire structure's symmetry. Types include:

- Primitive (P) ? particles at corners only
- Body-centered (BCC) ? particles at corners and center
- Face-centered (FCC) ? particles at corners and face centers

2. Solutions

- Define molarity and molality.

Molarity (M) is moles of solute per liter of solution. Molality (m) is moles of solute per kilogram of solvent.

- What is Henry's law?

Henry's law states that at constant temperature, the amount of gas dissolved in a liquid is directly proportional to the partial pressure of the gas above the liquid.

- Explain the concept of boiling point elevation and freezing point depression.

Both are colligative properties. Boiling point elevation occurs when dissolved particles raise the boiling point; freezing point depression lowers the freezing point. These effects depend on the number of solute particles, not their identity.

3. Electrochemistry

- Define standard electrode potential.

It is the electrode potential of a half-cell measured under standard conditions (1 M concentration, 1 atm pressure, 25°C) against the standard hydrogen electrode.

- What is the significance of Gibbs free energy in electrochemistry?

The Gibbs free energy change (ΔG) determines the spontaneity of an electrochemical reaction. A negative ΔG indicates a spontaneous reaction.

- Explain Faraday's laws of electrolysis.

First law states that the amount of substance deposited or liberated at an electrode is proportional to the quantity of electricity passed. The second law states that the amounts deposited by equal currents are proportional to their equivalent weights.

4. Chemical Kinetics

- What is the order of a reaction?

The order of a reaction indicates how the rate depends on the concentration of reactants. It is determined experimentally and can be zero, first, second, etc.

- State and explain the collision theory of reactions.

The collision theory states that chemical reactions occur when reactant particles collide with sufficient energy and proper orientation.

- What is activation energy?

Activation energy is the minimum energy required for reactant particles to undergo a successful collision leading to a reaction.

5. Surface Chemistry

- Define adsorption and desorption.

Adsorption is the process where molecules adhere to a surface, while desorption is the removal of adsorbed molecules from the surface.

- What are catalysts? How do they affect chemical reactions?

Catalysts are substances that increase the rate of a reaction without being consumed. They provide an alternative pathway with lower activation energy.

- Explain the importance of colloids in everyday life.

Colloids are important in products like milk, fog, smoke, and medicines, and have applications in industry, medicine, and environmental protection.

Protecting groups are used to temporarily mask reactive functional groups during multi-step synthesis, preventing unwanted reactions and allowing selective modification of other parts of the molecule, thus increasing overall yield and purity. What are the key factors influencing the reactivity of functional groups in pharmaceutical organic chemistry? Factors include electronic effects (like resonance and induction), steric hindrance, the presence of neighboring groups, and the reaction conditions such as pH, temperature, and solvent, all of which affect the reactivity of functional groups.
