Sample Questions and Model Answers from April 2014 Unit 3B

Below are examples of typical questions from the April 2014 exam, along with strategies for approaching them.

Example 1: Enthalpy Calculations

Question:

Calculate the standard enthalpy change of formation of methane, CH₄, given the following data:

- Combustion of methane: CH₄(g) + 2O₂(g) → CO₂(g) + 2H₂O(l) ΔH = -890 kJ
- Combustion of carbon: C(s) + O₂(g) → CO₂(g) ΔH = -393 kJ
- Formation of water: H₂(g) + ½O₂(g) → H₂O(l) ΔH = -285.8 kJ

Model Answer:

Using Hess's Law, rearranged to find the formation of CH₄:

- Write the target reaction:

- Combine given reactions:

- Combustion of methane (given)
- Reverse combustion of carbon to produce elemental carbon
- Use the formation of water to account for hydrogen

- Calculate:

$$\Delta H_f(\text{CH}_4) = [\Delta H_{\text{combustion of C}} + 2 \times \Delta H_{\text{formation of H}_2\text{O}}] - \Delta H_{\text{combustion of CH}_4}$$

But more straightforwardly, applying Hess's Law:

$$\Delta H_f(\text{CH}_4) = [\Delta H_{\text{combustion of CH}_4}] - [\Delta H_{\text{combustion of C}}] - 2 \times [\Delta H_{\text{formation of H}_2\text{O}}]$$

$$= (-890) - (-393) - 2 \times (-285.8)$$

$$= (-890 + 393 + 571.6) = 74.6 \text{ kJ}$$

Note: The calculated enthalpy change indicates the energy required to form methane from its elements.

Example 2: Cell Potential Calculation

Question:

Given the standard electrode potentials:

Calculate the standard potential for the overall reaction:

Model Answer:

Step 1: Write the half-reactions and identify oxidation and reduction:

- Reduction: $\text{Fe}^{2+} + 2\text{e}^{-} \rightleftharpoons \text{Fe}$ ($E^{\circ} = -0.44 \text{ V}$) (which is actually a reduction, but since E° is negative, it favors oxidation)

Step 2: Reverse the second reaction to find oxidation:

Step 3: Multiply the reactions to balance electrons:

- The first reduction involves 1 e^{-}

- The second (oxidation) involves 2 e^{-}

Multiply the first reaction by 2 to match electrons:

Now, combine with the oxidation:

Add the two:

But this simplifies to:

Step 4: Write the overall reaction:

The overall cell potential (E°) is calculated as:

$$E^{\circ} = E^{\circ}(\text{cathode}) - E^{\circ}(\text{anode})$$

Here, the cathode is $\text{Fe}^{3+}/\text{Fe}^{2+}$ ($E^{\circ} = +0.77 \text{ V}$), and the anode is Fe/Fe^{2+} ($E^{\circ} = -0.44 \text{ V}$). Therefore:

$$E^{\circ} = +0.77 \text{ V} - (-0.44 \text{ V}) = +1.21 \text{ V}$$

Final Answer:

The standard potential for $\text{Fe}^{3+} + 3\text{e}^{-} \rightarrow \text{Fe}$ is $+1.21 \text{ V}$.

When preparing for chemistry examinations, particularly within the Edexcel specification, understanding the mark scheme is a cornerstone of effective revision strategy. The January 2014 Edexcel Chemistry Mark Scheme offers not only a blueprint for examiners but also provides invaluable insights for students aiming to maximize their scores. This article delves into the intricacies of this specific mark scheme, dissecting its structure, key features, and how students and teachers alike can leverage it for optimal success.

Understanding the Purpose and Structure of the Edexcel Chemistry Mark Scheme

What is a Mark Scheme?

A mark scheme is a detailed guide used by examiners to assess students' responses uniformly and fairly. It outlines the accepted answers, the marking criteria, and how points are allocated for each part of a question. For the January 2014 chemistry paper, the mark scheme ensures consistency across different examiners and provides transparency for students to understand how their responses are evaluated.

Structure of the January 2014 Mark Scheme

The mark scheme for Edexcel Chemistry January 2014 is systematically organized, typically

following the order of the exam paper itself. It consists of:

- Question numbers: Correspond to each question on the exam paper.
- Level of response or mark allocation: Indicates how many marks each sub-part carries.
- Expected answers: Clear, concise points that students should include.
- Additional notes or alternative acceptable answers: To accommodate different valid approaches or wording.
- Indicative content and common misconceptions: To guide examiners in awarding marks appropriately.

This structure ensures that every aspect of student responses is scrutinized fairly, and partial credit is awarded where relevant.

Key Features of the January 2014 Mark Scheme

1. Emphasis on Precision and Scientific Terminology

The mark scheme underscores the importance of precise scientific language. For example, students are expected to use terms like ionic bond, molecular compound, or oxidation state accurately. Using correct terminology often earns additional marks, encouraging students to familiarize themselves with key vocabulary.

2. Clear Differentiation Between Full and Partial Answers

The scheme distinguishes between fully correct responses and those that are partially correct. For instance:

- Full marks are awarded when all parts of an answer are correct and well-explained.
- Partial marks are granted when some correct points are made, even if the answer is incomplete or contains minor errors.

This differentiation allows students to gain credit for their understanding, even if they do not produce perfect responses.

3. Guidance on Method and Working

Particularly in calculations and practical questions, the mark scheme emphasizes the importance of showing working steps. For example, in mole calculations, students are often required to show intermediate steps to receive full marks.

4. Flexibility in Acceptable Answers

The scheme accommodates synonyms and alternative phrasings. For example, in questions about bonding, "sharing electrons" and "covalent bonding" are both acceptable. This flexibility helps prevent penalizing students for different but correct scientific expressions.

5. Handling of Common Misconceptions

The January 2014 mark scheme anticipates typical student errors. For example:

- Confusing ionic and covalent bonding.
- Misunderstanding about the conservation of mass in reactions.
- Incorrect interpretation of experimental data.

By identifying these, the scheme guides examiners to award partial credit appropriately, encouraging accurate assessment.
